Dino-Mite: 'Jurassic Park' Back **In 3-D**

BY RAFER GUZMAN

© 2013, Newsday

NEW YORK — "Imagine yourself in the Cretaceous Period," says paleontologist Alan Grant in the opening minutes of Steven Spielberg's "Jurassic Park." Played by a sun-tanned Sam Neill, Grant is explaining to a mouthy kid what it would feel like to be hunted down by velociraptors, the wily dinosaurs who have since terrorized millions of moviegoers worldwide.

"The point is, you are alive when they start to eat you," says Grant. "So, y'know — try to show a little respect."

Twenty years after its release in the summer of 1993, "Jurassic Park" stomps back into theaters Friday in 3-D and IMAX. It's surely the opening salvo in Universal's publicity campaign for next year's planned sequel, "Jurassic Park 4," but it's also a chance to see whether Spielberg's big, brainy, science-savvy blockbuster will command respect from modern audiences. Will the movie's pioneering computer-generated effects still dazzle in 2013? Will its notions of cutting-edge technology pass the smell test? And beyond its massive popularity — \$914 million in ticket sales, a boxoffice record not broken until James Cameron's 1997 epic "Titanic" — what is the larger legacy of "Jurassic Park"?

"It's a real watershed for popular culture," says Matthew Carrano, curator of dinosauria at the Smithsonian's National Museum of Natural History in Washington, D.C. "Dinosaurs were always popular with children, but post-'Jurassic Park,' dinosaurs are much more acceptable across the board. Now there are adults who find dinosaurs interesting, and aren't embarrassed about it."

"Jurassic Park" captured imaginations of all ages with a simple premise: A wealthy entrepreneur, John Hammond (Řichard Attenborough), is bringing dinosaurs to life after 65 million years of extinction. Using tattered dino DNA taken from ancient mosquitoes preserved in amber, and plugging the gaps with fresh frog DNA, scientists can clone everything from a galloping Gallimimus to the towering Tyrannosaurus. Hammond's dream is a dinosaur theme park, though several humans — including Laura Dern and a pre-fame Samuel L. Jackson — find themseives living in a spiattery night-

It's based on the book by Michael Crichton, the late Harvard-educated doctor turned author and filmmaker, whose stories often mixed science-fiction with real facts. "The Andromeda Strain," his bestselling book of 1969, imagined an extraterrestrial microorganism that clots human blood; his 1981 thriller "Looker," which he wrote and directed, wondered what would happen if 3-D digital modeling were applied to humans.

"Jurassic Park" was even more believable. By 1993, scientists already had been extracting DNA fragments from amber-encased creatures, including a 30-millionyear-old termite. "Jurassic Park" met with some mockery — "Frogs are amphibians, dinosaurs are reptile Stepho movie Books convir "The c tacula

says D the sc "The I and bl one lo stand. from t where kind o stomp things fact.'

Un thenti Horne credite charac tional nosau birds, Horne helped genus, Horne the file cludin for Gr sories neckei

dinosaurs looked as accurate as they could for the science we had
