

Manager

From Page 1

A variety of experiences helped Nelson prepare for her current career, which began about four years ago when she was hired as the city manager of the City of Canton.

Mayor Nancy Wenande said recently that the Yankton City Commission wasn't worried about the fact that Yankton would only be Nelson's second city manager job.

"Her just having served as the city manager for four years really was minimized by the fact she had so much other experience to bring to the table," she said. "Through all facets of the interview process, the (City Commission) was impressed with Amy's high level of professionalism. She was able to showcase her skill set through a variety of successful community initiatives. Amy has taken some calculated risks over her career that have reaped great rewards."

After attaining a master's degree in urban planning from the Urban and Regional Studies Institute at Minnesota State University Mankato, her first position was as a downtown development director in Evanston, Wyo.

"There, I focused primarily on the local Main Street program, downtown revitalization and managing historic preservation projects," Nelson said.

Following that, she served as a senior community planner with the Brick Industry Association (BIA) in Chicago. In that position, Nelson was responsible for BIA's government relations and policy analysis, working with communities of various sizes in 17 states.

"My previous experiences prepared me for city management in a couple of ways," she explained. "First, having the opportunity to work at the department-head level gave me a great introduction into project management, budgeting, grant writing and understanding governmental operations. Having worked in so many communities across the country with the BIA, I have a wealth of knowledge on what makes communities strong and a lot of creative ideas to improve service and quality of life."

The experience in Canton, a community of about 3,000 people, taught Nelson a variety of lessons — first among them was that state of mind can set limitations.

"Whether you think you can do something, or you think you can't do something, you are probably right," she said. "Canton is a small town, but it has done big things. If people are willing to focus on a common goal and work together, we can change attitudes and accomplish anything."

It's important for city leaders to build strong partnerships and relationships, Nelson added.

"Another important lesson I learned in Canton is never to be satisfied," she continued. "I learned that good leadership requires innovation and looking for new ways to solve old problems."

One area that commitment to progress manifested itself was in Canton's economic development gains during Nelson's tenure.

"Canton's Economic Development Corporation and the City of Canton took a very aggressive and proactive stance on economic development over the past four years," she said. "The two entities worked very closely to establish a clear vision for the industrial park."

Steps were taken to determine the infrastructure needs of manufacturers so they would have the ability to grow. Several firms have expanded or built new facilities in Canton recently, including Adams Thermal Systems, Terex Bid-Well and Legacy Electronics.

Gaining a Ready Site Certification was part of the Canton Economic Development Corporation's marketing strategy. In July, the Canton Industrial Park was approved as the first South Dakota Certified Ready Site. The program provides consistent information on development-ready commercial and industrial sites available throughout the state.

"When a company is considering a location to build or grow their business, they want information relating to land availability, infrastructure and incentives in hand immediately," Nelson said. "Canton can provide that to them, and through the Governor's Office of Economic Development, Canton can also provide it to the world."

When Nelson begins her work in Yankton, she said the first order of business will be to learn as much as she can about the community and the city organization.

"This will include getting to know the department heads and staff, attending board and committee meetings of the city, and thoroughly familiarizing myself with the budget and ongoing projects," she stated. "I'll want to observe all the departments and projects first hand to get an understanding of their operations and any concerns. I think it will also be important for me to really dive into the community, attending events and organization meetings so I can get to know the citizens and culture of Yankton. I will also want to make sure to stay connected with the media so that the citizens of Yankton can become familiar with me."

Among Yankton's biggest assets are its recreational facilities, as well as its potential for recreational activities, according to Nelson. Also important is its strong economic base, growth opportunities and citizenry.

"Yankton is a really well-rounded community," Nelson said.

Infrastructure needs will provide some of Yankton's biggest challenges, she added.

"Another challenge Yankton has, but it is a good challenge, is how to prioritize," Nelson said. "With so many ideas, opportunities and enthusiasms, where to start and staying focused will certainly be an exciting challenge for Yankton and for me."

Of course, Nelson isn't entirely defined by her work. She also enjoys physically challenging herself by running a couple marathons each year, as well as doing half-marathons and yoga.

"As a Rotarian, I believe in service above self, so I enjoy helping others and volunteering in my church and in my community," she added. "I also like to play cards and have forewarned the whist players at the Senior Center that they may have met their match!"

Nelson said people may be surprised to learn that she has lived abroad and traveled all over the world.

"My favorite places include Norway, Spain and Argentina," she stated.

Nelson has repeatedly said that Yankton already feels like home, and she is excited to become a part of the community.

"I am a high-energy and enthusiastic person who will work hard to achieve the goals of the community," she stated. "I am so gracious for this opportunity and can't wait to get started. I have an open-door policy and always take time for questions, suggestions and complaints from citizens. The coffee will be on, and I look forward to meeting and working with everyone."

Pierre, Fort Pierre Usher In Holiday Season

PIERRE (AP) — The cities of Pierre and Fort Pierre are ushering in the holiday season.

KGFX reports that Pierre's 12th annual Parade of Lights gets underway at 6:30 p.m. Friday at the state Capitol. The route then heads west to Pierre Street and ends at the Legion Cabin.

Visitors are invited to hot chocolate, refreshments and chili.

The festivities then head to Fort Pierre with that city's annual Fort Pierre Christmas Tree Lighting and Chili Feed.

The tree will be lit in downtown Fort Pierre at about 7:30 p.m. Cookies and cocoa will be served and there will be a free will donation chili feed after the tree lighting.

Clinton Statue Takes A Tumble In Rapid City

RAPID CITY (AP) — Officials in Rapid City are trying to figure out what caused a life-size statue of former President Bill Clinton to topple onto its side.

The statue is part of the "City of Presidents" project, which includes statues of former leaders on street corners in downtown Rapid City. Police found the Clinton statue lying on the sidewalk early Thursday.

City of Presidents committee spokeswoman Nancy Engler tells the Rapid City Journal that it does not appear that the statue was hit by a vehicle. She says someone might have rocked it back and forth until it tipped off its base.

Engler says the statue did not suffer a lot of damage, but it will take time to rebuild the base and put the statue back on its moorings.

Comfort Care

Q Graduate from Hospice Care?

A. "You would never guess but my 102-year-old mother just graduated from hospice and we're still celebrating!" a friend excitedly told me as she wheeled her mother to a table for lunch at a local café.

Earlier this year her mother had part of her colon removed and she had such a tough time recovering she chose hospice care because she and her caregivers felt she had less than 6 months to live.

The daily home visits from the hospice staff were re-assuring for both pain relief and her colostomy care.

Miraculously, her mother perked up and began to become more independent as she regained her strength and began to feed herself again. Her daughter confidently assumed care of the colostomy.

The hospice staff agreed with the patient and family that she could "graduate" from hospice and resume her previous home health care.

This example illustrates that hospice is not always a last stop and that recovery from hospice care is indeed possible!!

Q What is a PA? (Physician's Assistant)

A. A physician's assistant (PA) is a medical professional who works as part of a team with a physician. A PA is a graduate of an accredited PA educational program who is nationally certified and state-licensed to practice medicine with the supervision of a physician.

PAs perform physical examinations, diagnose and treat illnesses, order and interpret lab tests, perform procedures, assist in surgery, provide patient education and counseling and make rounds in hospitals and nursing homes. All 50 states and the District of Columbia allow PAs to practice and prescribe medications. PAs are found in all areas of medicine, including the areas of primary care medicine, surgery and surgical subspecialties.

The PA educational program is modeled on the medical school curriculum, a combination of classroom and clinical instruction. The PA course of study is rigorous and intense. Physician Assistants receive a broad education in medicine. Their education is ongoing after graduation through continuing medical education requirements and periodic board recertification exams.

By design, physicians and PAs work together as a team, and all PAs practice medicine with physician supervision. Supervision does not mean, though, that a supervising physician must always be present with the PA or direct every aspect of PA provided care.

PAs are trained and educated similarly to physicians, and therefore share similar diagnostic and therapeutic reasoning. Physician-PA practice can be described as delegated autonomy. Physicians delegate duties to PAs, and within those range of duties, PAs use autonomous decision-making for patient care. This team model is an efficient way to provide high-quality medical care.

Ear, Nose & Throat

Q Dr. Rumsey for the past few weeks I have been having dizzy spells lasting for about 30 seconds when I get up or whenever I look up at something. What can I do?

A. What you are describing sounds like Benign Paroxysmal Positional Vertigo or BPPV. BPPV is one of the most common causes of dizziness. It causes short episodes of severe spinning. People often notice it in the morning when getting out of bed or if they tilt their head back to look at something above them. Currently there are no known precautions to prevent BPPV. Studies suggest half of the population will suffer from it sometime in life. Fortunately, diagnosis is easy and treatment is very effective. Always see a physician when suffering from any type of dizziness, imbalance, or lightheadedness as it is never anything to be taken lightly. Avera Medical Group ENT-Yankton is providing specialized testing for this and many other balance disorders. If you have questions regarding BPPV or are suffering from dizziness and imbalance contact us at 665 – 6820.

Podiatry

Q What can I do for arthritis in my ankles and feet?

A. There are more than 100 different types of arthritis, including gout and rheumatoid arthritis. The most common forms to affect the foot & ankle is post-traumatic and osteoarthritis, especially in the big toe, ankle and midfoot joints.

Seeking treatment early can improve the odds of preventing irreversible joint damage. For many patients with early-stage foot or ankle arthritis, changes in shoes or advanced custom orthotics can make a huge difference. While there is no fountain of youth for arthritis, there are more medical options available than ever before.

Big Toes
Baby Boomers are most likely to develop osteoarthritis in their big toe joint. During walking, the big toe absorbs forces equal to nearly twice a person's body weight. It plays an important role in stooping and standing. Some boomers start to develop big toe stiffness, a condition called hallux limitus, in their forties.

Better surgical procedures now offer improved pain relief and joint movement to Boomers with early stage arthritis at the big toe. Patients with advanced and severe arthritis may need to have the joint fused or replaced. But stronger screws and hardware are helping fusions last longer while slashing recovery times. A new generation of big toe joint replacements shows promise.

Ankles
Ankles are another prime spot for arthritis. Ankles are more likely to develop post-traumatic arthritis than osteoarthritis. For many Baby Boomers, the trauma was an ankle fracture or a bad sprain that may have happened in their teens or twenties. Innovative new surgical techniques allow foot and ankle surgeons to transplant small plugs of cartilage from one part of the ankle to another in some patients, slowing joint deterioration.

Ankle replacements are becoming more popular, and better ankle replacement implants are now available. Sometimes the ankle becomes too arthritic to resolve the pain without surgery. The only option used to be a fusion. Now, with advancements in implant technology, the ankle can be replaced just like they do for a shoulder, knee, or hip.

Q Should I vaccinate my children?

A. There are only a few remote places on earth where cases of polio still strike, yet sixty years ago millions everywhere were paralyzed and killed by this virus. What changed?-- the widespread distribution of the polio vaccine.

Nearly every family in the first half of the twentieth century was touched by the tragedy of children dying of diphtheria. What changed?-- a vaccine was. Ever see a case of lockjaw? Probably not in the U.S. because most people are protected by tetanus vaccine.

Vaccination is the greatest advance in human and animal health ever developed. (Proper drinking water and waste management are right up there, too.) Some parents have concerns that vaccination is linked to autism. This association has been thoroughly investigated, completely debunked and is false.

But it is true that the U.S. has had more cases of whooping cough (pertussis) this year than any year since 1959 because pertussis vaccination rates have been falling.

It is in your children's best interest to have all the recommended vaccinations. To do otherwise is to depend on herd immunity (which has been decreasing) and is placing your kids at serious and avoidable risk.

Urological

Q Did you know?

A. Men may have a higher risk of prostate cancer if they eat a lot of red meat and "processed" meats. They may also have a more advanced stage of their cancer when it is first detected. Does this mean one should not eat red meat? No, just avoid "processed" meats and cut the fat off your steak. Eat more fish such as salmon which is high in Omega 3 fatty acids.

Diets high in sodium (salt) and if you drink a lot of diet sodas are associated with a higher risk of kidney damage by reducing the kidneys ability to filter the blood. Even 2 or more cans per day have been shown to reduce the kidney's ability to filter the blood. Sodas sweetened with regular sugar, juices, and iced tea were not associated with any decrease in kidney function.

Chiropractic

Q What is chiropractic about?

A. Chiropractic care is a great choice for many different types of problems and especially wellness. It is a personalized service of professionals who take time to understand the patient's history and problem. It continues to rank high in patient satisfaction rates. Historically, it has great benefits in a multitude of conditions. Chiropractic has withstood the controversy in health care and wellness. And, over the past several years, research has proven the effectiveness of chiropractic care in various conditions of pain and pain management. With increased demand by their patients, it has been made more accessible to the public. If you are considering chiropractic, please visit us and use our resources available on our website at firstchiropracticcenter.com.

Have a safe and healthy Christmas season!

Fitness/Health

Q I seem to get too busy over the holidays to work out and plan healthy meals. How can I make sure I don't gain weight this year?

A. This is a popular question and one that just takes a little bit of planning and will power. Here are just a few tips to help your holidays be a little bit more healthy. At many homes the holidays are centered around food. This year try centering your get together around an activity, go for a walk, play a game outdoors etc. Shorten your goal for workouts. Take your usual 30-45 workout down to 15-minutes during your busy weeks. That way you will certainly have time to do it and you won't skip it all together when you feel like you don't have enough time. Don't graze at the buffet table. Put your food on a plate and sit down to eat it. Indulge in a single portion of the food you're craving.

Research shows if you avoid your cravings all together you're more likely to binge on other foods later.

I hope these help you have a healthy holiday season!

Pharmacy/Nutrition

Hepatitis C testing for ALL baby boomers. What's up? If you were born between 1945 and 1965, 3% of you have hepatitis C. Doesn't sound like very many, but that is 5 times higher among adults born in any other era. The baby boomers have been exposed before universal precautions and blood screening of hepatitis C were standards of care. Exposure to infected blood is the most common route of exposure.

What is hepatitis C? This is an infection of the liver caused by the hepatitis C virus, leads to damages to the liver and can cause liver failure. It is very difficult for the body to rid itself of the virus and usually is symptom free in the beginning. Hepatitis C infection is the leading cause of liver transplantation in the U.S. and is a risk factor for liver cancer.

What population do you see this infection in most often? The most common is among people who share needles among users of illicit drugs, accidental needlestick in health care workers, and prior to 1992, from transfusions of blood or blood products. This is an infection that can be transmitted from mother to new born child, also.

What are the symptoms? When first infected, 75% have no symptoms and the other 25% may complain of fatigue, loss of appetite, muscle aches or fever. Over time these same symptoms can show up along with yellowing of skin or eyes. As this infection progresses, the infection becomes life threatening.

This is the right time for testing and treating. New drugs are available with up to 75% cure rates for some patients. CDC now recommends this testing for all baby boomers plus any other persons with known risk factors, such as IV drug abuse, HIV or dialysis. Ask your physician with your next annual visit, or sooner if you have concerns. Now is the time to take charge of your future health!

Kim Kortje
